DT Trade Scanner

A Unique Routine Only Available in

Dynamic Trader

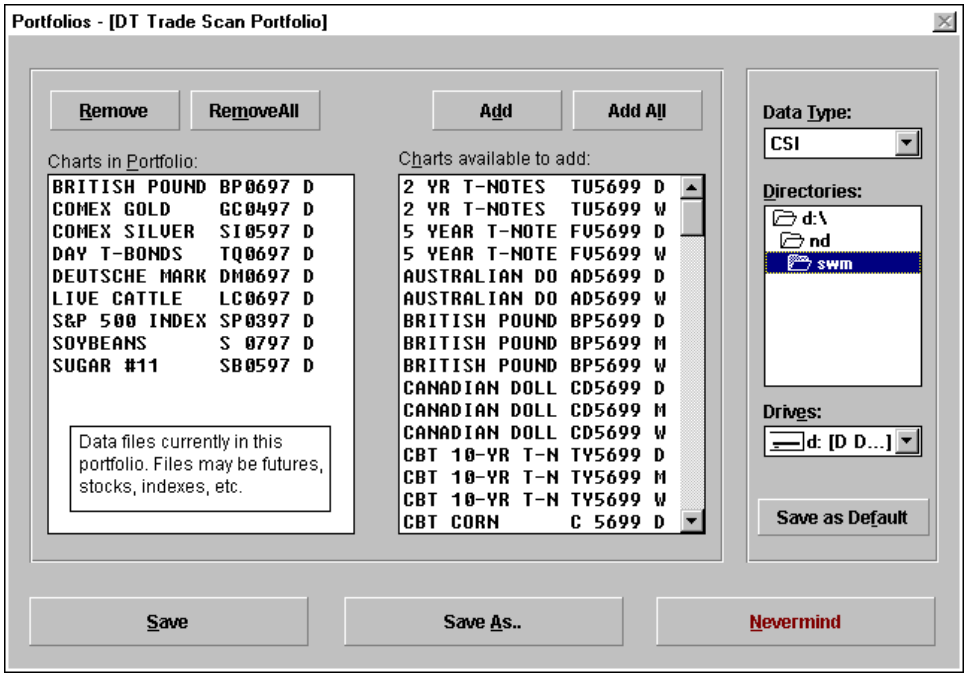
The Dynamic Trader Software includes a valuable routine for identifying short-term trade set-ups called the **DT Trade Scanner**. Some of these set-ups may also be used as *trend-continuation* entry strategies.

The **DT Trade Scanner** will search any portfolio of futures or stocks at the end of the day and identify which markets have made the trade set-up as well as the buy or sell price-trigger to enter the trade. The Dynamic Trader Trading Course which is included with the software describes the initial protective stop-loss level for each trade.

Dynamic Trader Portfolio

A portfolio of any number of futures contracts or stocks may be built with Dynamic Trader's portfolio builder. The portfolio example below shows a small portfolio of seven futures markets. The portfolio could just as well include an unlimited number of individual stocks

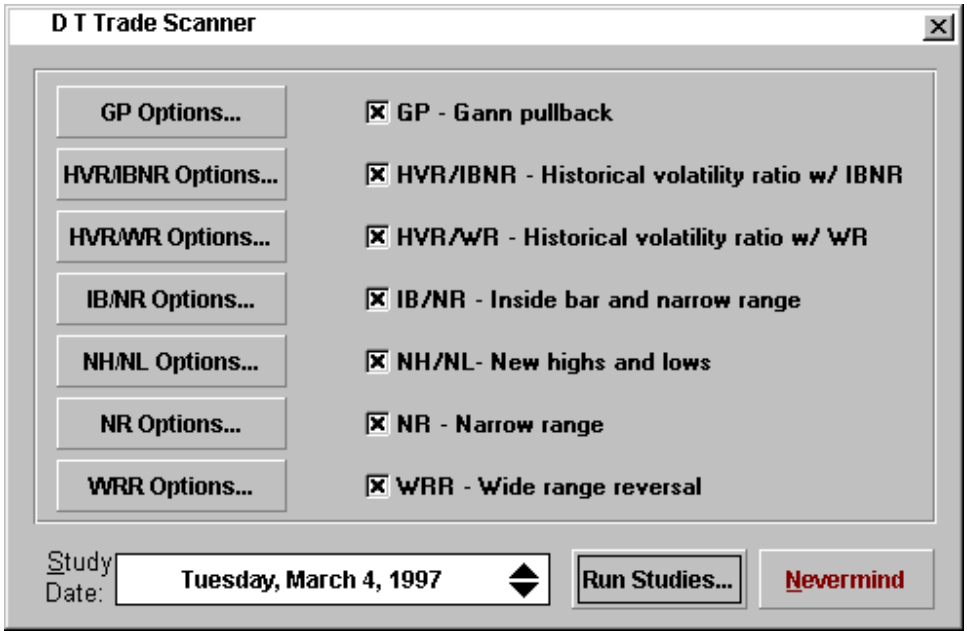
The data files that make up the portfolio do not have to all be in the same sub-directory. Dynamic Trader may built the portfolio from data files located in any number of sub-directories on the hard drive.



Short-Term Trade Set-Ups

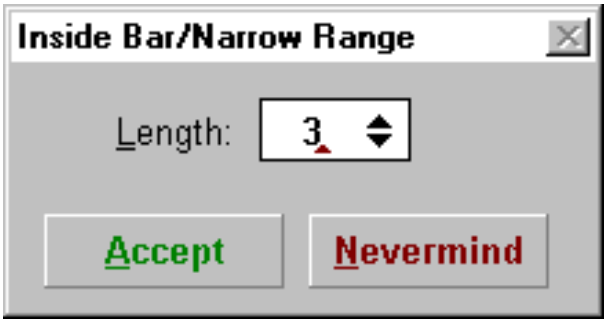
There are seven short-term trade set-ups included in the DT Trade Scanner. The user may chose which set-ups to include in the scan. The scan routine will then test every market in the portfolio to see if any of the set-ups are valid at the end of the day. Several of these trade set-ups are described in Connor's and Raschke's book, *Street Smarts*, which I highly recommend.

Version 2 of Dynamic Trader which is scheduled to be released in the fall 1997, includes several additional set-ups for a total of 19. Several of the set-ups from Jeff Cooper's recent book, *Hit and Run Trading* will be included.



Trade Set-Up Options

Each of the trade set-up parameters may be chosen by the user. The default parameters are the ones that are most reliable for the widest range of markets. The picture below shows the parameter options just one of the set-ups, Inside Bar / Narrow Range.

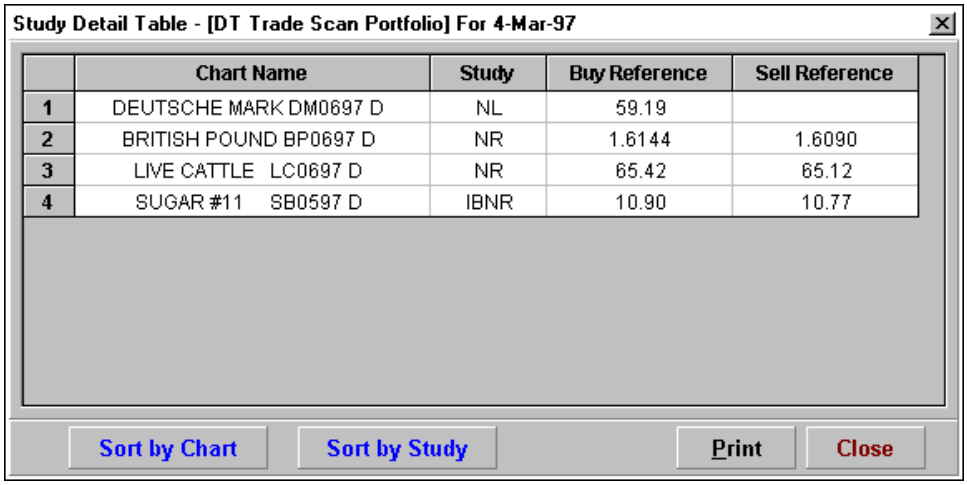


Study Detail Table

The portfolio of seven markets shown above was scanned at the end of the day of March 4. Four markets met at least one of the trade set-up parameters. The DM met the New Low (NL) parameters. In this case, the DM made a new low for the past twenty days and the new low is at least

three days from the previous 20 day low. Traders would buy one tick above the Buy-Reference price if the market rallied on March 5.

Both the BP and Cattle met the Narrow Range (NR) parameters (narrowest range day of the past seven days). The Buy and Sell Reference prices represent the high and low of the narrow range day's on March 4. Traders would buy one tick above the Buy Reference or sell one tick below the Sell Reference for March 5.



Study Detail Table - [DT Trade Scan Portfolio] For 4-Mar-97

	Chart Name	Study	Buy Reference	Sell Reference
1	DEUTSCHE MARK DM0697 D	NL	59.19	
2	BRITISH POUND BP0697 D	NR	1.6144	1.6090
3	LIVE CATTLE LC0697 D	NR	65.42	65.12
4	SUGAR #11 SB0597 D	IBNR	10.90	10.77

Sort by Chart | Sort by Study | Print | Close

Sugar met the Inside Bar / Narrow Range (IB/NR3) parameters on March 4. March 4 was both an *inside-day* and the narrowest range day of the previous three days. Traders would buy one tick above the Buy Reference or sell one tick below the Sell Reference price for March 5. You might want to review your charts of these four markets for March 5 and see which trades were triggered on that day.

The DT Trading Course describes the protective stop-loss levels for each of these trade set-ups as well as how to incorporate these signals into the trading plan.

Only Well Tested, High-Probability and Low Capital Exposure Trade Set-Ups Included With The DT Trade Scanner

The objective of technical analysis is to identify *high probability trade opportunities*. The DT Trade Scanner does just this each day. I have only included those set-up strategies that have been found to be consistently reliable in a wide variety of markets. Version 2 of Dynamic Trader will include a total of 19 trade set-ups in the DT Trade Scanner routine. Owners of Dynamic Trader Version 1.1 will receive Version 2 at no

charge, not even shipping and handling. The current price of the ***Dynamic Trader Software and Trading Course*** (Version 1.1) is $900 plus shipping. The price of Version 2 will be $1500. If you are interested in the ***Dynamic Trader Software and Trading Course***, now is the time to make the purchase before the major price increase for Version 2.
